

# Integrating PowerApps with External Systems

# Agenda

- Calling External Services using HTTP Actions
- Executing Child Flows from a Parent Flow
- Creating and Testing Custom Connector
- Configuring a Custom Connector to use OAuth

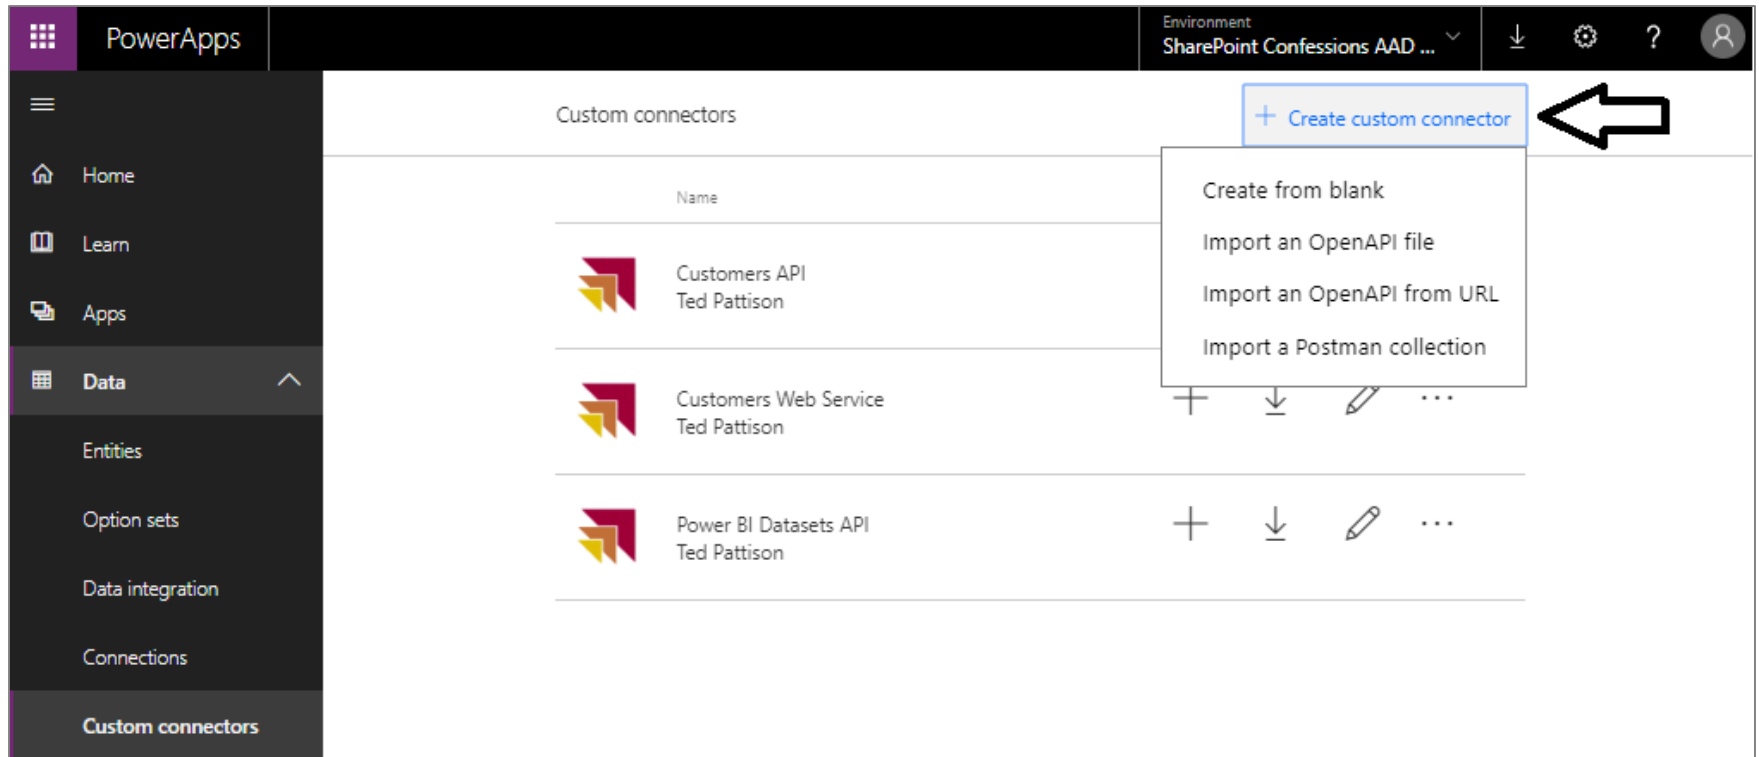

# Standard Connectors vs Custom Connectors

- PowerApps Supports two types of connectors
  - Standard connectors supplied out-of-box and vetted by Microsoft
  - Custom connectors created by organizations for their own use

# Creating a New Custom Connector

The screenshot shows the PowerApps interface. The top navigation bar includes the PowerApps logo, the environment name "SharePoint Confessions AAD ...", and icons for download, settings, help, and user profile. The left sidebar contains a menu with "Home", "Learn", "Apps", "Data", "Entities", "Option sets", "Data integration", "Connections", and "Custom connectors". The "Custom connectors" section is active, displaying a table of existing connectors. A "+ Create custom connector" button is highlighted in the top right, with a large black arrow pointing to it. A dropdown menu is open below this button, showing four options: "Create from blank", "Import an OpenAPI file", "Import an OpenAPI from URL", and "Import a Postman collection".

# Defining Requests

Request

+ Import from sample

\* Verb

The verb describes the operations available on a single path.

GET

\* URL

This is the request URL.

http://subliminalsystems.com/api/Customers/

Path

Path is used together with Path Templating, where the parameter value is actually part of the operation's URL.

Query

Query parameters are appended to the URL. For example, in /items?id=####, the query parameter is id.

Headers

These are custom headers that are part of the request.

Body

The body is the payload that's appended to the HTTP request. There can only be one body parameter.

Request

+ Import from sample

\* Verb

The verb describes the operations available on a single path.

GET

\* URL

This is the request URL.

http://subliminalsystems.com/api/Customers({CustomerId})

Path

Path is used together with Path Templating, where the parameter value is actually part of the operation's URL.

\* CustomerId ...

Query

Query parameters are appended to the URL. For example, in /items?id=####, the query parameter is id.

Headers

These are custom headers that are part of the request.

Body

The body is the payload that's appended to the HTTP request. There can only be one body parameter.

# Defining the Response

← Connector Name Customers Web Service

1. General > 2. Security > **3. Definition** > 4. Test

✓ Update connector ✕ Close

▼ Actions (2)

Actions determine the operations that users can perform. Actions can be used to read, create, update or delete resources in the underlying connector.

1 GetCustomers ...

2 **GetCustomer** ...

+ New action

▼ References (0)

References are reusable parameters used by both actions and triggers.

← Back

Response

+ Import from sample

\* Name

default

Headers

These are custom headers that are part of the response.

References Used

The following are the references used by this entity

Body

The payload that is available on the response. These are the tokens that will show up as the outputs in designer.

Address ... BirthDate ... City ... Company ... CustomerId ...

EmailAddress ... FirstName ... FirstPurchaseDate ... Gender ...

HomePhone ... LastName ... LastPurchaseDate ... State ... WorkPhone ...

Zipcode ... odata.metadata ...

Validation

This helps you identify potential issues with this response.

Validation

# Creating an Azure AD Application

The screenshot shows the Microsoft Azure portal interface. On the left is a dark sidebar with navigation options: 'Create a resource', 'All services', 'FAVORITES', 'Dashboard', 'All resources', 'Resource groups', 'App Services', and 'Azure Active Directory'. The main content area has a breadcrumb trail: 'Home > sharepoint confessions aad directory - App registrations > Create'. Below the breadcrumb is a 'Create' modal window. Inside the modal, there are three required fields, each marked with a red asterisk and an information icon: 'Name' with the value 'Power BI Customer Connector' and a green checkmark; 'Application type' with a dropdown menu set to 'Web app / API'; and 'Sign-on URL' with the value 'https://localhost' and a green checkmark. At the bottom of the modal is a blue 'Create' button.

# What About the Redirect URL?

The image displays two screenshots of the OAuth 2.0 configuration interface, likely from the Azure portal, showing the process of setting up a custom connector.

**Left Screenshot (Initial State):**

- OAuth 2.0** (Header)
- Identity Provider:** Azure Active Directory
- Client id \***: 0d956d63-2b3a-4a6b-8b21-5b43db48cc77
- Client secret \***: [Redacted]
- Login URL**: https://login.windows.net
- Tenant ID**: common
- Resource URL \***: https://analysis.windows.net/powerbi/api
- Scope**: scope
- Redirect URL**: Save the custom connector to generate the redirect URL
- Edit** (Link)

**Right Screenshot (Final State):**

- OAuth 2.0** (Header)
- Identity Provider**: Azure Active Directory
- Client id \***: 0d956d63-2b3a-4a6b-8b21-5b43db48cc77
- Client secret \***: [Redacted]
- Login URL**: https://login.windows.net
- Tenant ID**: common
- Resource URL \***: https://analysis.windows.net/powerbi/api
- Scope**: Scope
- Redirect URL**: https://msmanaged-na.consent.azure-apim.net/redirect
- Edit** (Link)

Red arrows indicate the transition from the initial state to the final state, specifically highlighting the change in the Redirect URL field.

# GetDatasets

## Request

It defines the pre-requirements needed in order to make a request. Describes a single operation parameter. A unique parameter is defined by a combination of a name and location.

### Request

+ Import from sample

#### \* Verb

The verb describes the operations available on a single path.

#### GET

#### \* URL

This is the request URL.

```
https://api.powerbi.com/v1.0/myorg/groups/{workspaceId}/datasets
```

# RefreshDataset

## Request

It defines the pre-requirements needed in order to make a request. Describes a single operation parameter. A unique parameter is defined by a combination of a name and location.

### Request

+ Import from sample

#### \* Verb

The verb describes the operations available on a single path.

#### POST

#### \* URL

This is the request URL.

```
https://api.powerbi.com/v1.0/myorg/groups/{workspaceId}/datasets/{datasetId}/refreshes
```

#### Path

Path is used together with Path Templating, where the parameter value is actually part of the operation's URL.

\* workspaceId ...

\* datasetId ...

#### Query

Query parameters are appended to the URL. For example, in /items?id=####, the query parameter is id.
