

Getting Started with the Common Data Service

Agenda

- Common Data Service Overview
- Creating the CDS Database
- Understanding Entities
- Importing Data into the CDS Database
- Building Model-driven Apps
- Creating a Custom Entity

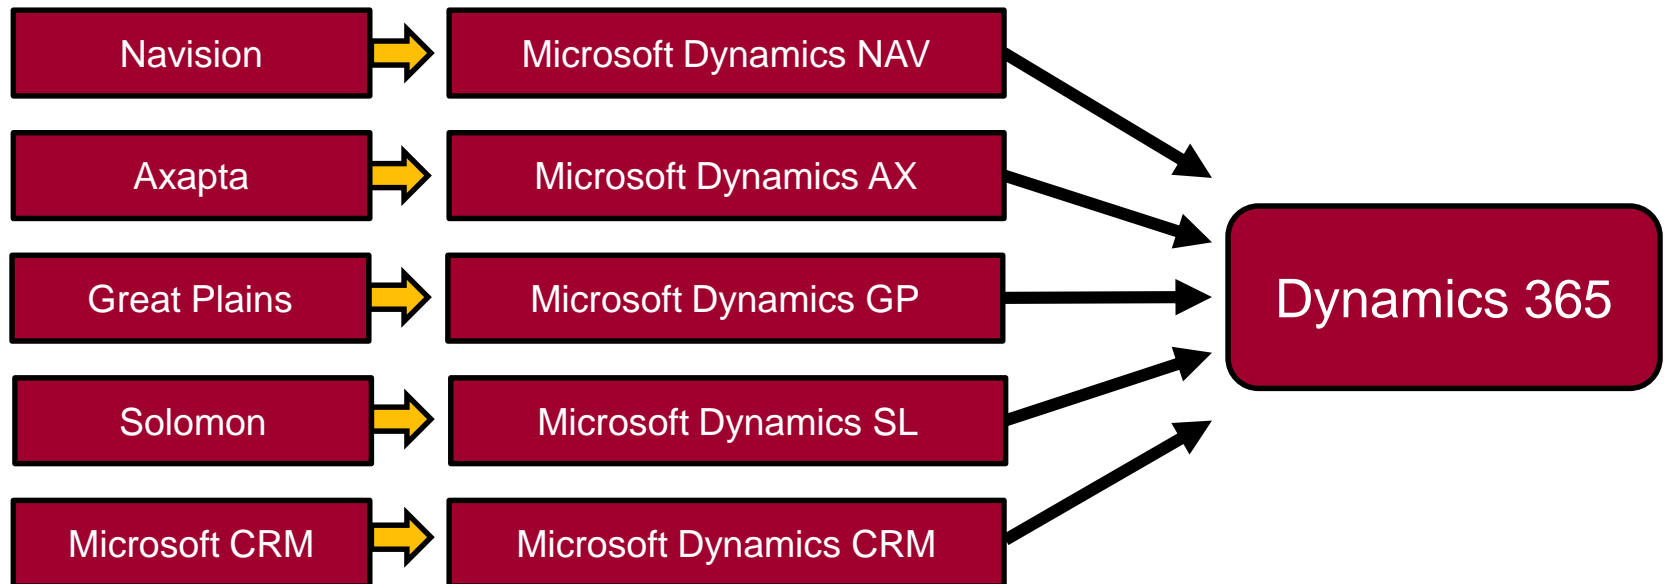

What is Common Data Service?

- Platform for building business applications
 - Business application include CRMs, ERPs, etc.
 - Provides common database infrastructure
- What does CDS for Apps provide?
 - Standard database schema of common entities
 - Extensible design for extending and creating entities
 - Ability to build entity-specific UI components
 - Ability to build entity-specific business logic
 - Ability to build apps by assembling components

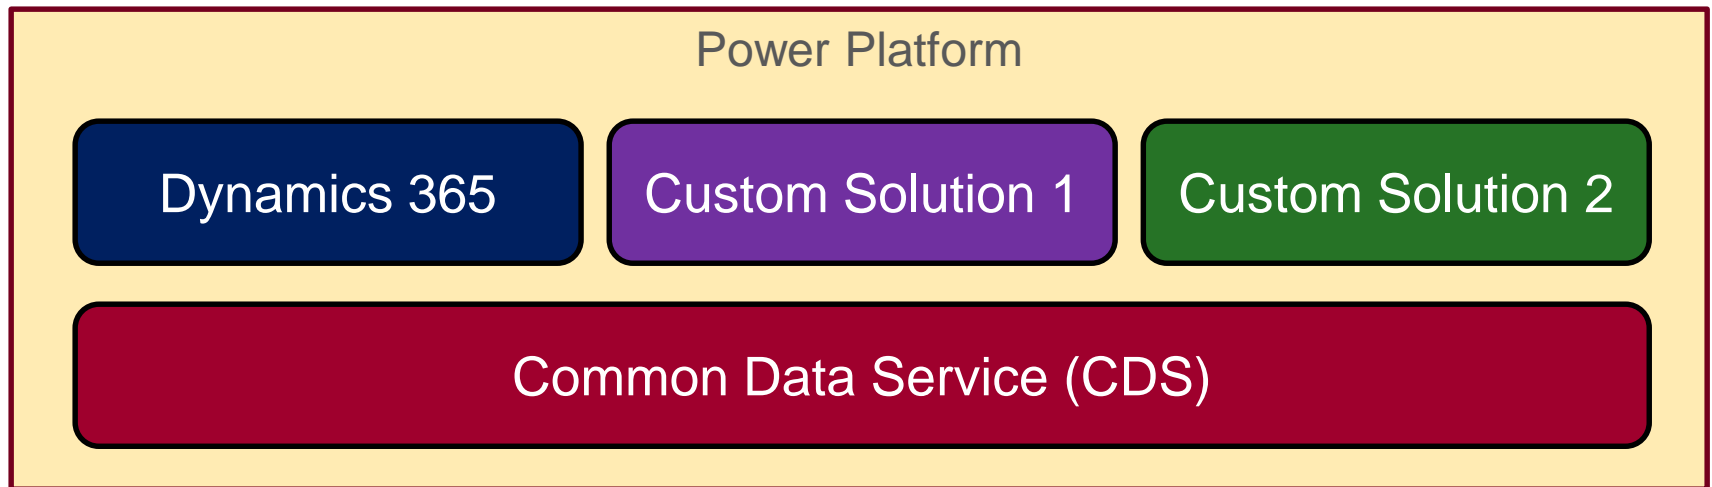

Evolution of Microsoft Business Application Suite

- Microsoft has acquired many software companies
 - Several acquisitions involved software that targets CRM and ERP
 - Microsoft evolved many software applications into Dynamics suite
 - Dynamics 365 represents evolution from on-premises to cloud

Birth of the Power Platform

- Microsoft migrating infrastructure out of Dynamics 365
 - CDS has infrastructure for building entity-based business solutions
 - Dynamics 365 is now collection of entities with UI and logic
 - Custom solutions can be built using entities with UI and logic
 - CDS provides foundation of Power Platform

Common Data Model (CDM)

- What is the Common Data Model (CDM)?
 - Open-sourced definition of standard entities
 - Entities are well-defined, modular, and extensible
 - structural and semantic consistency across apps and deployments
- CDM helps integrate and *disambiguate data* from
 - business processes
 - digital interactions
 - product telemetry
 - people interactions

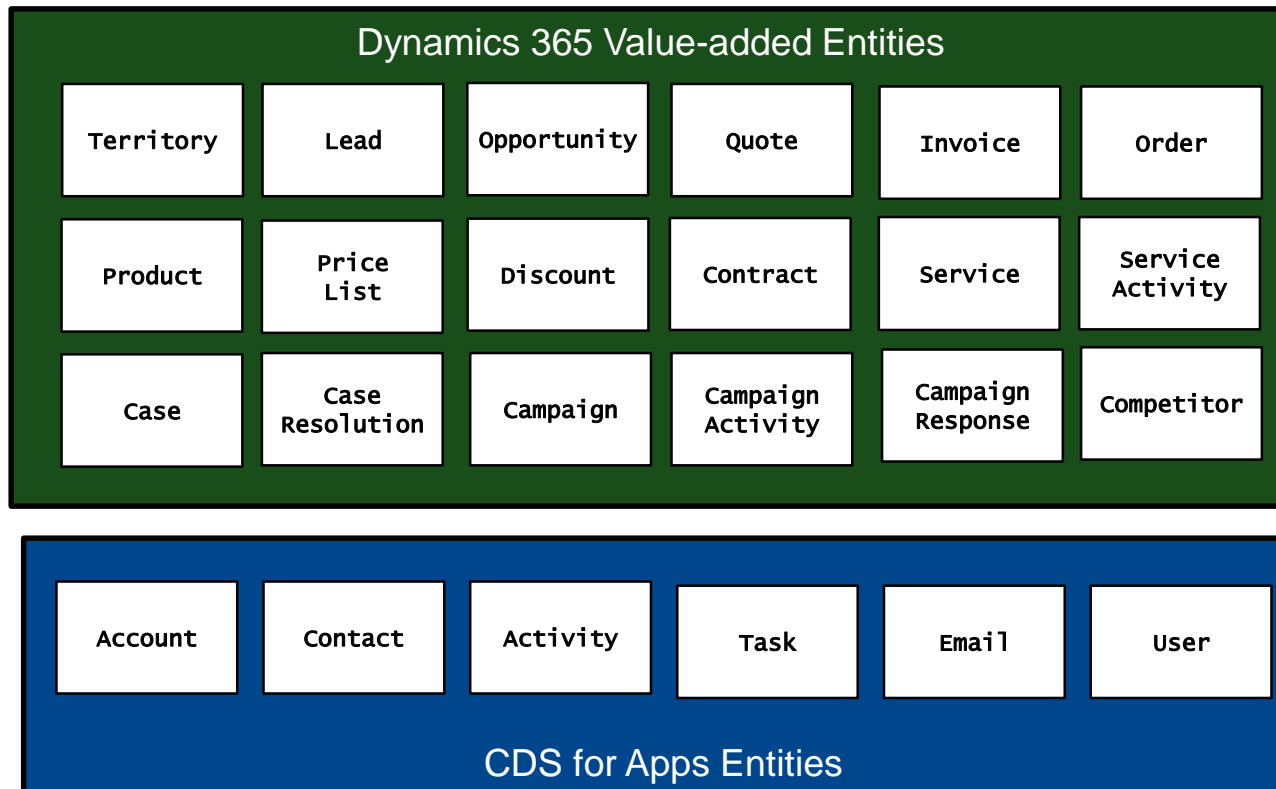

Common Database Model Schema

- CDM defines set of entities available to all applications
 - **Account:** represents an business entity that can be invoiced
 - **Contact:** represents a human being
 - **Activity:** represents an event that can be schedule
 - **Task:** represents work item that can be assigned to user or team
 - **Email:** represents email message sent or received
 - **User:** represents system user who can be owner of records

CDS for Apps vs Dynamics 365 for Sales

- CDS for Apps provides base set of entities
 - Custom solutions can extend and add entities
 - Dynamics 365 add a large set of its own entities

Agenda

- ✓ Common Data Service Overview
- Creating the CDS Database
 - Understanding Entities
 - Importing Data into the CDS Database
 - Building Model-driven Apps
 - Creating a Custom Entity

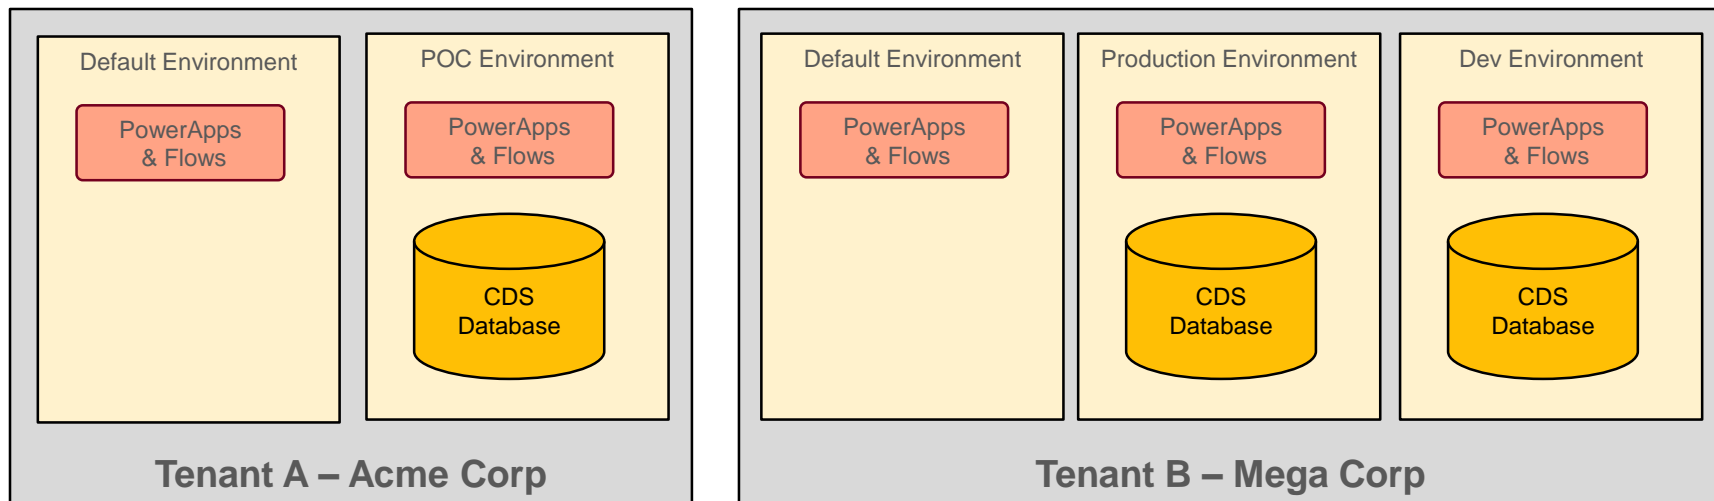

PowerApps Plan 2

- Certain design tasks require PowerApps Plan 2
 - You can start a 30-day trial for PowerApps Plan 2
 - License must be assigned to individual user accounts

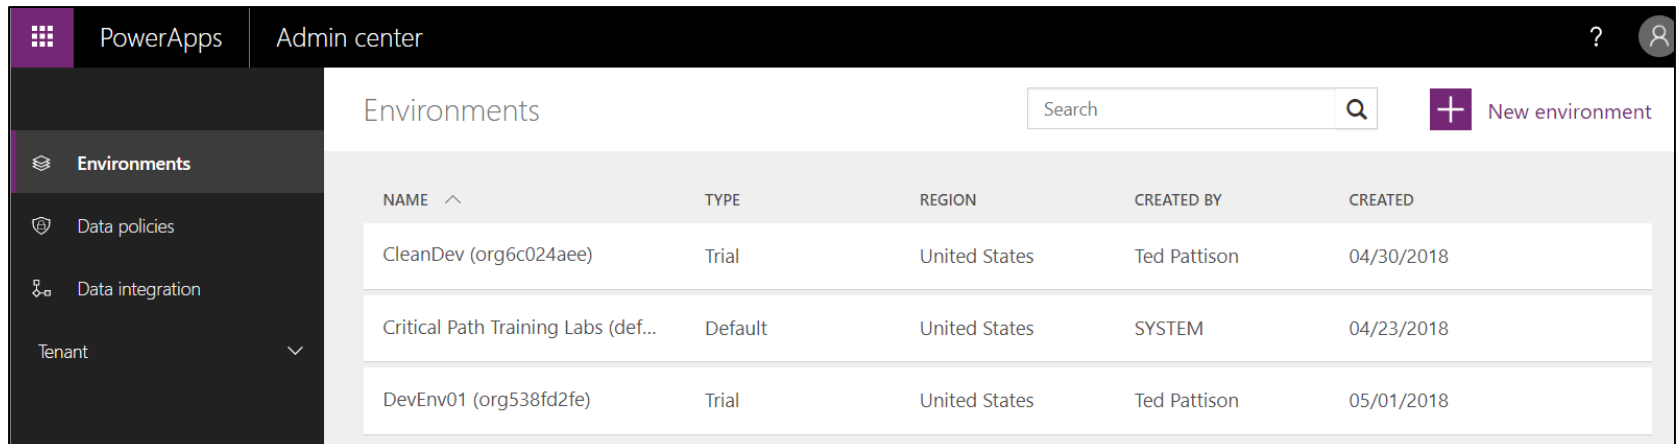

What is an Environment?

- Environment is container for PowerApps, Flow and the CDS
 - Each environment and its resources exist within a geographic region
 - Environment resources include PowerApps, Flows and CDS database
 - Environment represents a governance and security boundary
 - Every tenant is provisioning with a default environment
 - Administrator can provision additional environments if needed
 - Environment can be provisioned with or without a CDS database
 - Environment can contain only one CDS database

Environments and CDS for Apps

- Environments managed in PowerApps Admin Center
 - You can configure security and access
 - You can create new environments
- Access to environment controlled at 3 different levels
 - Environmental roles
 - Resource permissions for apps and flows
 - CDS Database roles

PowerApps Admin center

Environments

Search

+ New environment

NAME ^	TYPE	REGION	CREATED BY	CREATED
CleanDev (org6c024aee)	Trial	United States	Ted Pattison	04/30/2018

DevEnv01 (org538fd2fe)	Trial	United States	Ted Pattison	05/01/2018

Environment Roles (Admin and Maker)

- Environment Admin role
 - Change role membership
 - Create new environments with or without CDS database
 - View and manage all resources created in environment
 - Set Data Loss Prevention policies
- Environment Maker role
 - Create apps, connections, custom APIs, gateways, and flows
 - Create and extend CDS entities (*requires PowerApps plan 2*)

Creating the CDS for Apps Database

- Steps to create a new CDS for Apps Database
 1. Navigate to Power Apps Admin Center
 2. Create a new environment
 3. Configure the new environment with a CDS for Apps database
 4. Add option to include sample data [Optional]

New environment
Create new environments for app and flow development and to maintain separate databases. [Learn more](#)

Environment name

Region ?

Can't be changed once your environment is created.

Environment type ?

✓ You created an environment

**Do you want to create a database?
(Recommended)**

Your environment includes access to the Common Data Service. Create a database to start using it.

- Collect, store, and share data.
- Use data modeling
- Create custom forms
- Manage security and access to data

Create a database for this environment ?
Choose the currency and language your data should use.

Currency ?

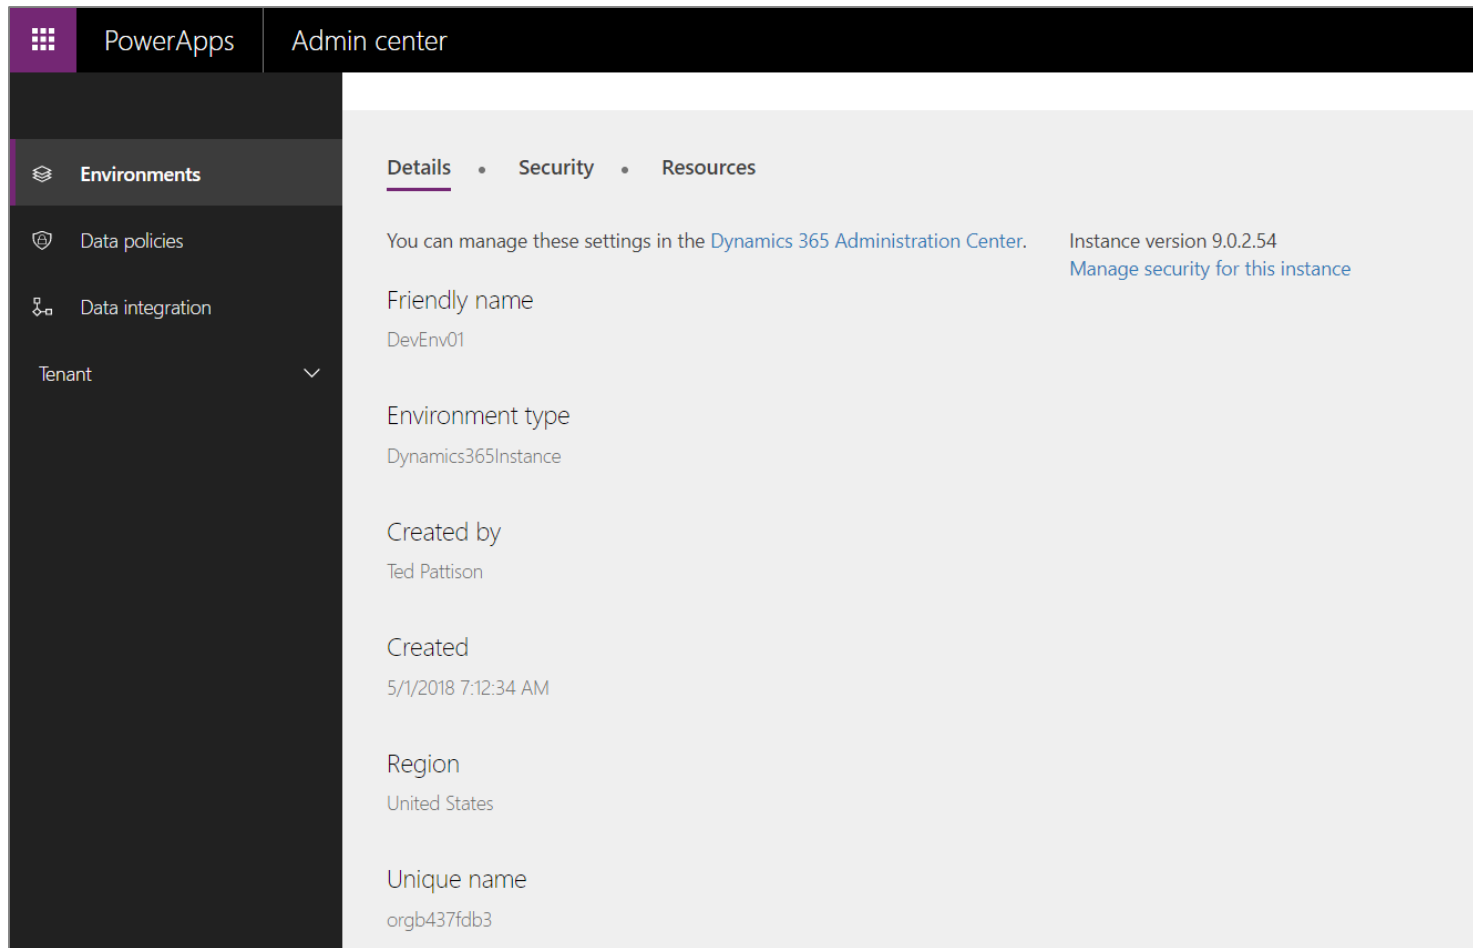

Language ?

☒ Include sample apps and data

① By choosing **Create my database**, you agree Microsoft can use entity and field names that you create (but not content in the database tables) to help improve our common data model. These names may be stored in our diagnostic systems and copied across regions. [Learn more](#)

Examining the New Environment

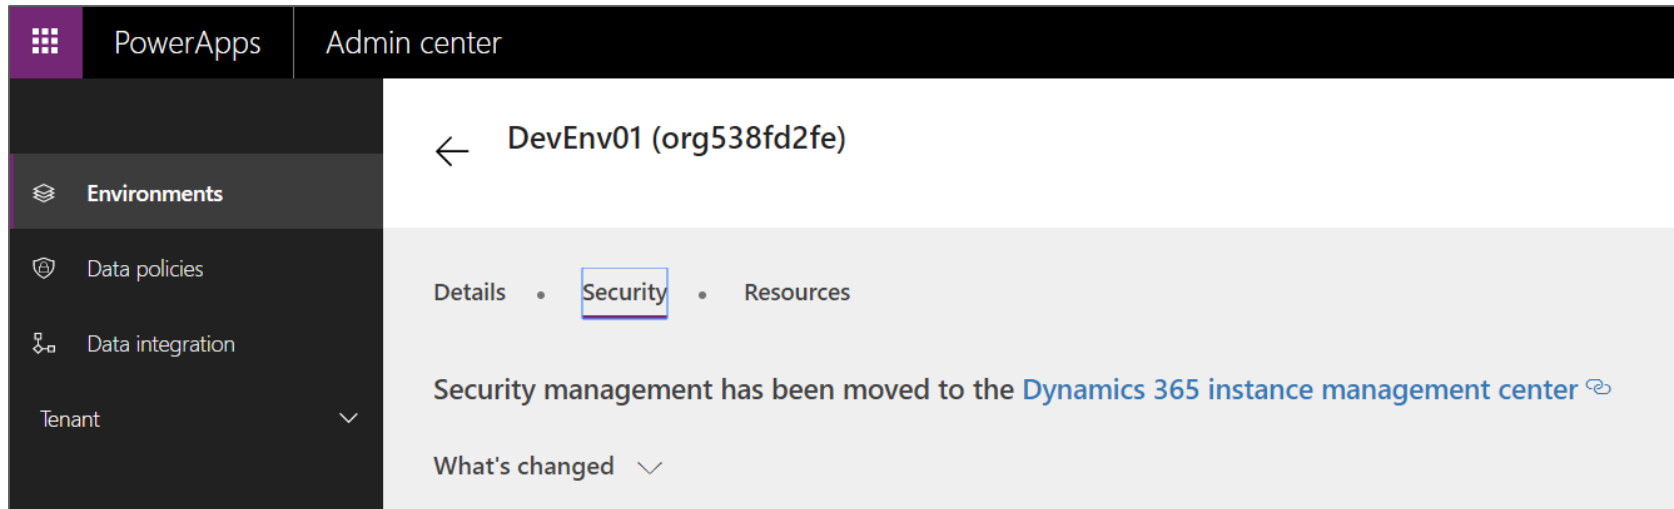

The screenshot displays the PowerApps Admin center interface. The top navigation bar includes the PowerApps logo and the 'Admin center' title. A left-hand sidebar contains navigation options: 'Environments' (selected), 'Data policies', 'Data integration', and 'Tenant'. The main content area is titled 'Details' and includes tabs for 'Security' and 'Resources'. It provides information about the current environment, including its name, type, creator, creation date, region, and unique name. A note at the top of the details section indicates that settings can be managed in the Dynamics 365 Administration Center and provides a link to manage security for the instance.

Details	Security	Resources
You can manage these settings in the Dynamics 365 Administration Center . Instance version 9.0.2.54 Manage security for this instance

Configuring Environment Security

The screenshot displays the PowerApps Admin center interface. The top navigation bar includes the PowerApps logo and the text "Admin center". The left sidebar contains the following menu items: "Environments" (highlighted), "Data policies", "Data integration", and "Tenant". The main content area is titled "DevEnv01 (org538fd2fe)" and features a breadcrumb trail: "Details • Security • Resources". The "Security" tab is currently selected and highlighted with a blue border. Below the breadcrumb, a message states: "Security management has been moved to the [Dynamics 365 instance management center](#)". At the bottom of the main area, there is a section labeled "What's changed" with a downward arrow.

Environmental Security Roles

- User access to CDS data based on roles
 - Environment security configured in terms of business units
 - CDS pre-defines common security roles
 - You can define custom security roles as well

Security Roles	
Business Unit: org6c024aee ▾	
 New    More Actions ▾	
<input type="checkbox"/> Name ↑	Business Unit
Common Data Service User	org6c024aee
Delegate	org6c024aee
Environment Maker	org6c024aee
Product Manager	org6c024aee
System Administrator	org6c024aee
System Customizer	org6c024aee

Security Role Configuration – Core Records

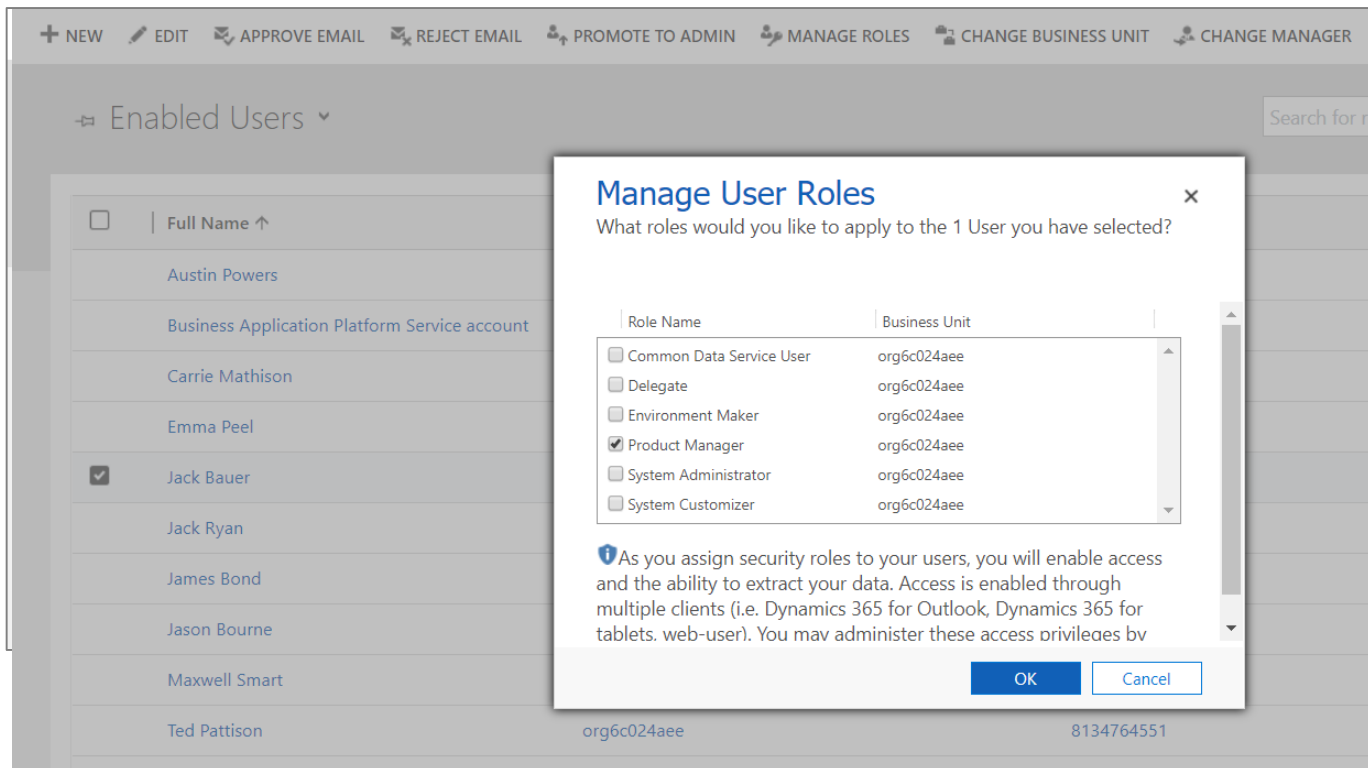

- Roles define access to specific entities
 - Permissions include **create**, **read**, **write**, **delete**, etc.

Security Role: New Security Role								
<div>DetailsCore RecordsBusiness ManagementCustomizationMissing EntitiesBusiness Process FlowsCustom Entities</div>

New Accounts By Month	Managed	True	Shows the number of new accounts in a month.

Solution Explorer

- Solution Explorer provides top-level view of customizations
 - Can be challenging to find in current UI experience

CDM Extensibility

- You can modify most standard entities
 - Modification involves adding fields
 - Existing fields cannot be modified or removed
 - System entities cannot be modified
- You can create custom entities
 - Herein lies the ability to design complex business apps

DEMO

Building a Canvas App to Read and Write Contacts

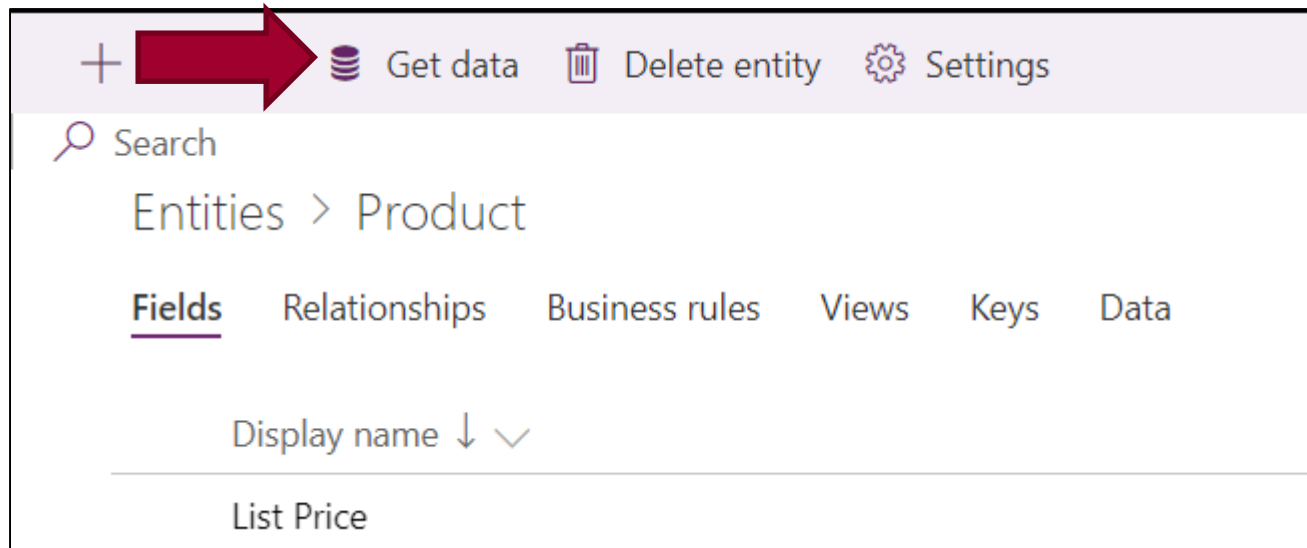

Agenda

- ✓ Common Data Service Overview
- ✓ Creating the CDS Database
- ✓ Understanding Entities
- Importing Data into the CDS Database
 - Building Model-driven Apps
 - Creating a Custom Entity

Importing Data

- You can import data from external sources
 - Data can be added to table for new or existing entity
 - Importing tools include Power Query in the browser

Selecting an External Datasource

- Select a supported datasource connector

The screenshot shows the 'Choose Data Source' dialog box in Power Query. The main window is titled 'Connect to Data Source'. On the left, there is a list of data sources, with 'Azure SQL database' selected. The right pane shows the connection settings for this selected source.

Connection settings

Server:

Database:

Connection credentials

On-premises data gateway:

Authentication Kind:

Username:

Password:

At the bottom of the dialog, there are three buttons: 'Back', 'Cancel', and 'Next'.

Primary Name

- Every entity created with Primary name field
 - Display name can be changed to something more appropriate

The screenshot shows a database management interface. At the top, there is a toolbar with icons and labels for '+ Add field', 'Get data', 'Delete entity', 'Settings', and 'Delete field'. Below this is a search bar with a magnifying glass icon and the text 'Search'. The main content area shows the breadcrumb 'Entities > Product'. Underneath, there are tabs for 'Fields', 'Relationships', 'Business rules', 'Views', and 'Keys'. The 'Fields' tab is selected. A table lists the fields for the 'Product' entity. The first field is 'Primary Name', which is marked as the primary field with a checkmark icon. The table has columns for 'Display name', 'Data type', and 'Type'.

Moving to Model-driven Apps

- What are the key benefits of model-driven apps?
 - Rich no-code design environment focusing on components
 - Create apps with consistent UI navigation, elements & metaphors
 - Design apps using the building blocks of Dynamics 365
 - Create responsive apps that work on desktop and mobile devices
 - Build apps into solutions that can be distributed and versioned
- What are the steps to building a model-driven app?
 - Model business data using entities in Common Data Model (CDM)
 - Define business processes on top of app-specific entity model
 - Compose the app UI on top of entities and business processes

MDA Components and Designers

- Model-driven apps assembled using components
 - App designer builds app by adding components
 - Components used to compose app functionality and appearance
 - App metadata consists of components and component properties
- App components separated into four categories
 1. Data components
 2. Logic components
 3. UI components
 4. Visualization components

Data Components

- Entity
- Field
- Option set field
- Relationship

UI Components

- App
 - Top-level collection of components
 - Tracks fundamental app properties, client type, and app URL
- Site map
 - Provides navigation across other UI components
- Form
 - Provides set of data-entry fields for a specific entity
- View
 - Read-only view of records for a specific entity
 - Defines display columns, column width, sort behavior and filters

Business Logic Components

- Business process flow
 - Interactive logic to walk user through standard business process
 - User moves flow from step to step until flow completes
- Workflow
 - Non-interactive logic to automate business process
 - Once workflow starts, it runs to completion without user interaction
- Actions
 - Logic that can be invoked manually by user
- Business rule
 - Logic to define rule or validation constraints to a form
- Flow
 - Microsoft Flow logic to read or write data to external sources
